🌸 Cambridge Care Services

Live Integration Guide

Virtual Care Assistant — Website Deployment Manual
Target Domain: `cambridgecareservices.co.uk` • Platform: Next.js / Universal Web

1. Executive Summary

This guide outlines the integration of the CQC-compliant AI Virtual Care Advisor onto **cambridgecareservices.co.uk**. The widget operates as a floating chat bubble in the bottom-right corner of all web pages with a non-intrusive **"Gentle Greeting"** pill.

- **Zero Layout Disruption:** Sits cleanly in a separate DOM layer; does not affect existing page styles or scripts.
- **Zero Speed Impact:** Uses `async` and deferred loading; core scripts only execute when the user interacts.
- **Fully Responsive:** Automatically adapts from desktop browsers down to mobile phone screens.

2. Exact Code Placement: Above </body>

Regardless of whether you choose Method A or Method B, the script tag must be placed **at the very bottom of your HTML document, immediately before the closing `</body>` tag**.

> 📌 **Golden Rule for Placement**
> Always place the script just before `</body>`. This guarantees the entire website visuals, navigation, and content load instantly without waiting for any secondary widgets.

```
<!DOCTYPE html>
<html lang="en">
  <head>
    <title>Cambridge Care Services</title>
    <!-- Website meta tags, fonts, stylesheets -->
  </head>
  <body>
    <!-- ALL EXISTING WEBSITE CONTENT (Navbar, Hero, Services, Footer) -->

    <!-- ========================================================= -->
    <!-- 👉 PASTE THE 1-LINE CODE RIGHT HERE, JUST ABOVE </body>  -->
    <!-- ========================================================= -->
    <script src="https://cdn.jsdelivr.net/gh/pankajatd/cambridge-care-chatbot@main/widget.js" asyn
c></script>

  </body>
</html>
```

3. Choose Your Integration Method

Two deployment options are available. Both require only **one single line of code** on the live site.

Factor	Method A: Global CDN (Recommended)	Method B: Self-Hosted in Website Folder
Setup Speed	**30 seconds** (Paste and go)	~2 minutes (Download file & upload to server)
Script Line	`<script src="https://cdn.jsdelivr.net/..." async></script>`	`<script src="/widget.js" async></script>`
Future Updates	**Automatic:** Updates in GitHub apply immediately to the site.	**Manual:** Requires re-uploading `widget.js` to server.
Best For	Standard web deployments, rapid rollout, zero maintenance.	Strict corporate intranets blocking external CDN URLs.

Method A: The Fast 1-Line Way (Global CDN)

Pasting this single line pulls the optimized script from jsDelivr's high-speed global cache:

```
<script src="https://cdn.jsdelivr.net/gh/pankajatd/cambridge-care-chatbot@main/widget.js" async></
script>
```

Method B: The Self-Hosted 1-Line Way

1. Download `widget.js` from the repository: `https://raw.githubusercontent.com/pankajatd/cambridge-care-chatbot/main/widget.js`
2. Save the file into your website's root public directory (e.g. `public/widget.js`).
3. Paste this line before the closing `</body>`:

```
<script src="/widget.js" async></script>
```

4. Next.js Implementation (cambridgecareservices.co.uk)

Because the website is built on **Next.js**, the web developer can include it cleanly in the root layout (`app/layout.tsx`):

```
import Script from 'next/script';

export default function RootLayout({ children }: { children: React.ReactNode }) {
  return (
    <html lang="en">
      <body>
```

```
        {children}

        {/* Cambridge Care Services Virtual Care Assistant */}
        <Script
          src="https://cdn.jsdelivr.net/gh/pankajatd/cambridge-care-chatbot@main/widget.js"
          strategy="lazyOnload"
        />
      </body>
    </html>
  );
}
```

5. Pre-Launch Verification Checklist

☐ Open website in a fresh incognito browser window.

☐ Confirm the floating 🌸 circular button is visible in the bottom-right corner.

☐ Wait 4.5 seconds to verify the subtle "*Need care guidance?*" greeting pill appears.

☐ Click the bubble and verify the full care assistant opens with all 4 Popular Inquiry tabs.

☐ Verify mobile layout on iOS Safari and Android Chrome.
